BARRACUDAWARE Yosemite Server Backup Description:

Yosemite Backup is a complete and affordable data backup and protection solution, enabling you to backup all of your data and restore it quickly. With broad support for multiple server applications, operating systems, and backup devices, Yosemite Server Backup provides a centralized interface to manage your backup strategy.

- Cross-platform support for Windows, Linux, and NetWare
- Agents for Microsoft Exchange, Microsoft SQL Server, and more
- "Bare Metal Restore" from backups
- Efficient compression and encryption of data
- High-performance, concurrent data streams for backup and recovery
- Backs up to disk, CD/DVD, tape drives, autoloaders, and robotic libraries
- Automated scheduling and media rotation interfaces
- Alerting of backup completion or errors
- Centralized management across multiple servers, applications, and devices

Yosemite Server Backup Offerings:

There are four levels of Yosemite Server Backup to meet the needs of any size organization:

1. **Yosemite Server Backup** is a low-cost entry into the Yosemite Server Backup product family, licensed to support a single Windows, Linux, or Netware server.
2. **Yosemite Server Backup Plus** offers support for small server farms, with support for up to 3 servers. Advanced agents for Microsoft SQL Server, Microsoft Exchange, and Bare Metal Disaster Recovery are included.
3. **Yosemite Server Backup SBS/EBS** is designed for users of Microsoft Windows Small Business Server and Microsoft Windows Essential Business Server and includes support for all essential Microsoft services -- Microsoft SQL Server, Microsoft Exchange, Microsoft SharePoint, and Active Directory. Yosemite Backup SBS/EBS includes support for up to three servers.
4. **Yosemite Backup Unlimited** is designed for enterprises. With no per server or per option fees, Yosemite Backup Unlimited is the most affordable enterprise-class backup solution available today.

Feature Details:

Bare Metal Disaster Recovery. Enables a one-step restoration of a complete system (operating system, applications, user data, system state) directly from backup media.

Microsoft Exchange Agent. Enables "hot backup" of Microsoft Exchange while online. Performs full and incremental backups and offers granularity of selection to individual storage groups and information stores. Automatically purges log files following backup. Supports Microsoft Exchange 2000 and higher for backup and restore.

Microsoft SQL Server Agent. Enables "hot backup" of Microsoft SQL Server while online. Performs full and incremental backups and offers granularity of selection to individual databases. Automatically truncates transaction logs following backup. Supports Microsoft SQL Server 7 and higher for backup and restore.

Disk to Disk to Any (D2D2NE). Integrated virtual archive architecture abstracts archive data from the physical media. Facilitates easy staging of backups across tiered backup hierarchies over the network. Least Recently Used (LRU) policies can automatically move lower priority data to the next storage tier (e.g., from disk to optical media or tape.) Replication policies can automatically maintain redundant archives to offsite locations to disaster recovery. Secure erase technologies ensure that data moved to next storage tier can be completely eliminated.

Tape Library Expansion. Provides integrated support for multiple drives in robotic tape library systems.
